

mylife touch

Patient Information at the touch of a finger

We implement biometric sensors in hospital admissions areas, emergency rooms, labs, pharmacies, schools, cruise ships and retirement communities as a means of positive identification, fraud prevention, location access and payment.

The myLife-Touch program provides free fingerprint devices to facilities allowing them to have immediate access to an individual's health information in an emergency.

FOUNDATION

How do you obtain fingerprint devices – at no charge?

Emergency and medical staff register for access to the patient information. Registration is free and available to certified EMTs with a current license.

How does the community sign-up? The myLife-Touch program is offered at various locations. An individual registers at the location where the services would be rendered.

What type of information do medical staff receive via fingerprint? The myLife-Touch program connects to the patient's MedicAlert health record which includes identification information, medical conditions, medications/dosages, allergies, past medical history, advance directive/DNR orders, emergency contacts, and health insurance information. In addition it connects to any native software programs at each of the facilities participating in the program.

What is the associated privacy policy? The myLife-Touch program is powered through MedicAlert Foundation. MedicAlert complies with HIPAA and other state and federal standards designed to protect patient's privacy. MedicAlert manages a comprehensive audit trail of all accessed fields and data.

The fingerprint technology encrypts scanned reference points and at no time does a fingerprint image leave the sensor. Original fingerprint images are never transmitted, stored or shared. Upon cancellation of the program fingerprint images are deleted.
